

WSTP Electra

K&H Bank launches for its corporate clients the web-based instantly processing module of the Electra internet banking system, the WSTP Electra. **WSTP Electra** allows the establishment of a **direct link** with the **company's accounting, business management system (ERP) and the Electra client program and through it with the Bank** on various platforms in the form of standard, so-called web service calls for enquiries about account information. Concurrently with WSTP Electra, you can use K&H web Electra and Electra24, and the Electra client program can be used in normal, manual mode as well.

Benefits

- **easily interfaceable** with the corporate financial systems
- **safe**, encoded information flow
- **allows for fast information enquiries**
- helps you **save** a significant amount of **time and costs**
- **enhances the efficiency** of internal financial processes

The **WSTP Electra** module applies a direct, protected and safe data link with the account information processes. **Account information reports, statements** can be downloaded automatically, and thus, transferred directly to the financial systems of the company. This solution enables companies to optimise their business and accounting processes, and improve their efficiency. **Account information that can be queried:**

- details of the transactions performed that day
- account balances
- account statements
- notifications (e.g., postal payments)

Upon request, **transfer orders sent to the Bank can also be input and imported in an automated way.** It is also possible to conduct encrypted data transmission from the accounting system to the Electra client program. This solution **eliminates manual data input, and consequently, considerably enhances data and information security** of transfer orders. Following this, after logging in to the Electra client program you can authenticate and sign the orders, and forward them to the Bank for processing.
